Keywords: crystal structure; hybrid solid; caesium; rubidium; trigonal prism.**CCDC references:** 1941895; 1941894**Supporting information:** this article has supporting information at journals.iucr.org/e^aDepartment of Chemistry, University of Aberdeen, Meston Walk, Aberdeen AB24 3UE, Scotland, and ^bDepartment of Chemistry, University of St Andrews, St Andrews KY16 9ST, Scotland. *Correspondence e-mail: w.harrison@abdn.ac.uk

The isostructural title compounds, poly[piperazin-1-ium [di- μ -bromido-caesium]], $\{(C_4H_{11}N_2)[CsBr_2]\}_n$, and poly[piperazin-1-ium [di- μ -bromido-rubidium]], $\{(C_4H_{11}N_2)[RbBr_2]\}_n$, contain singly-protonated piperazin-1-ium cations and unusual ABr_6 ($A = Cs$ or Rb) trigonal prisms. The prisms are linked into a distinctive 'curtain wall' arrangement propagating in the (010) plane by face and edge sharing. In each case, a network of $N-H\cdots N$, $N-H\cdots Br$ and $N-H\cdots(Br,Br)$ hydrogen bonds consolidates the structure.

1. Chemical context

Oxide perovskites of generic formula ABO_3 , where A and B are metal ions, have been studied for decades because of their physical properties and structural variety (Tilley, 2016). The aristotype (highest-possible symmetry) for this familiar structure type is a cubic network (space group $Pm\bar{3}m$) of vertex-sharing, regular, BO_6 octahedra encapsulating the A cations in 12-coordinate cavities bounded by eight octahedra, but lower symmetry structures are very common (Woodward, 1997). More recently, 'hybrid' RMX_3 perovskites containing organic cations and MX_3 ($M = Pb, Sn \dots$; $X =$ halide ion) octahedral networks have attracted intense interest because of their remarkable photophysical properties (Xu *et al.*, 2019; Stylianakis *et al.*, 2019; Zuo *et al.*, 2019). A number of different organic cations occur in these hybrid structures, one of which is the doubly protonated $C_4H_{12}N_2^{2+}$ piperizinium (or piperazin-1,4-diiium) ion as found in the $C_4H_{12}N_2 \cdot ACl_3 \cdot H_2O$ ($A = K, Rb, Cs$) family (Paton & Harrison, 2010) and $C_4H_{12}N_2 \cdot NaI_3$ (Chen *et al.*, 2018).

As an extension of these studies, we now describe the title hybrid compounds, containing the singly protonated $C_4H_{11}N_2^+$ piperazin-1-ium cation, which have a generic formula of RMX_2 and totally different crystal structures to RMX_3 hybrid perovskites.

Symmetry code: (iii) $x - 1, y, z$.

2. Structural commentary

Compounds (I) and (II) are isostructural and crystallize in the orthorhombic space group *Pbcm*. The smaller unit-cell volume (by 5.3%) of (II) presumably reflects the smaller ionic radius (Shannon, 1976) of the Rb⁺ cation ($r = 1.66$ Å) compared to Cs⁺ ($r = 1.81$ Å). This structure description will focus on (I) and note significant differences for (II) where applicable.

The asymmetric unit of (I) consists of two methylene groups, an NH group and an NH₂⁺ group; both nitrogen atoms and their attached H atoms lie on a (001) crystallographic mirror plan (at $z = 1/4$ for the asymmetric atoms). The structure is completed by a caesium atom [site symmetry $m(001)$, Wyckoff site $4d$] and two bromine atoms: Br1 [$m(001)$; $4d$] and Br2 ($2[100]$; $4c$). The structure of (I) is shown in (Fig. 1).

The complete C₄H₁₁N₂⁺ cation is generated by reflection to result in a typical (Brüning *et al.*, 2009) chair conformation for the ring: N1 and N2 deviate from the mean plane of C1/C2/C1ⁱ/C2ⁱ [symmetry code: (i) $x, y, \frac{1}{2} - z$] by 0.656 (5) and -0.682 (4) Å, respectively. The H atom of the neutral N2—H3N group has an equatorial orientation with respect to the ring.

The caesium coordination polyhedron in (I) is completed by crystal symmetry, resulting in a distinctive CsBr₆ trigonal

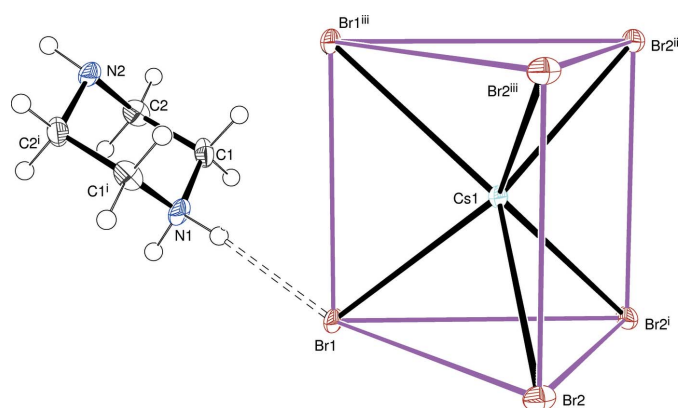

Figure 1
The asymmetric unit of (I) showing 50% displacement ellipsoids expanded to show the complete organic cation and the caesium coordination polyhedron. The N—H...Br hydrogen bond is shown as a double-dashed line. The purple lines linking the bromine atoms emphasize the trigonal-prismatic shape of the CsBr₆ polyhedron. Symmetry codes: (i) $x, y, \frac{1}{2} - z$; (ii) $x - 1, y, \frac{1}{2} - z$; (iii) $x - 1, y, z$.

prism (Fig. 1): the prism has longitudinal (001) mirror symmetry, with the Br1 atoms and the metal atom lying on the mirror. The mean Cs—Br bond length based on four distinct Cs—Br bonds (Table 1) is 3.573 Å [mean Rb—Br bond length for (II) = 3.461 Å; Table 2]. These data may be compared with the shortest Cs—Br separation of 3.716 Å in CsBr (8-coordinate caesium chloride structure) and the shortest Rb—Br separation of 3.427 Å in RbBr (6-coordinate rocksalt structure).

In (I), the prism ends (Br1/Br2/Br2ⁱ and Br1ⁱⁱⁱ/Br2ⁱⁱ/Br2ⁱⁱⁱ; see Fig. 1 for symmetry codes) are parallel by symmetry and separated by 4.5787 (8) Å, *i.e.*, the a unit-cell parameter, hence there is no twisting of the end faces and the Br...Br...Br angles vary from 56.65 (1)–61.68 (1)^o [the equivalent prism-end separation for (II) is 4.4675 (13) Å]. The caesium cation in (I) is not quite equidistant from the prism-ends mentioned in the previous sentence, being displaced from them by 2.3177 (6) and 2.2605 (5) Å, respectively. The equivalent data for the Rb atom in (II) are 2.2581 (9) and 2.2091 (9) Å, respectively. The bond-valence sum (BVS) for Cs1 (in valence units) using the formalism of Brese & O’Keeffe (1991) in (I) is 1.12 and the equivalent value for Rb1 in (II) is 0.95 (expected value in both cases = 1.00). This indicates that the bond valences of these cations are satisfied without notable underbonding or overbonding in these unusual coordination environments.

It may be finally noted that the bromide ions have very different coordination environments: Br1 bridges to two metal atoms [Cs1—Br1—Cs1^{iv} = 78.17 (2) in (I); Rb1—Br1—Rb1^{iv} = 79.21 (3)^o in (II); symmetry code: (iv) $x + 1, y, z$] whereas Br2 has an unusual distorted square planar BrCs₄ arrangement: the cis Cs—Br2—Cs bond angles in (I) vary between 80.367 (13) and 100.865 (16)^o; the five atoms are exactly coplanar by symmetry.

3. Supramolecular features

The extended structure of (I) is consolidated by hydrogen bonds (Fig. 2, Table 3. The N1—H1N...N2 bond from the protonated NH₂⁺ group to the unprotonated N atom in an

Figure 2
Detail of the structure of (I) showing the hydrogen-bonding environment of the C₄H₁₁N₂⁺ cation; symmetry codes: (i) $x, y, \frac{1}{2} - z$; (ii) $x + 1, y, z$; (iii) $-x, -y + 1, z + \frac{1}{2}$; (iv) $-x, -y + 1, -z$.

| $N1-H1N\cdots N2^{ii}$ | 0.92 (4) | 1.95 (4) | 2.868 (4) | 179 (3) |
| $N1-H2N\cdots Br1$ | 0.84 (4) | 2.45 (4) | 3.284 (3) | 174 (4) |
| $N2-H3N\cdots Br2^{iii}$ | 0.95 (4) | 3.07 (3) | 3.756 (2) | 130 (1) |
| $N2-H3N\cdots Br2^{iv}$ | 0.95 (4) | 3.07 (3) | 3.756 (2) | 130 (1) |

 Symmetry codes: (ii) $x+1, y, z$; (iii) $-x, -y+1, z+\frac{1}{2}$; (iv) $-x, -y+1, -z$.

Table 4
 Hydrogen-bond geometry (Å, °) for (II).

| $D-H\cdots A$ | $D-H$ | $H\cdots A$ | $D\cdots A$ | $D-H\cdots A$ |
|--------------------------|-------|-------------|-------------|---------------|
| $N1-H2N\cdots N2^{ii}$ | 0.91 | 1.92 | 2.825 (6) | 179 |
| $N1-H1N\cdots Br1$ | 0.91 | 2.40 | 3.300 (4) | 171 |
| $N2-H3N\cdots Br2^{iii}$ | 0.94 | 3.07 | 3.762 (3) | 131 |
| $N2-H3N\cdots Br2^{iv}$ | 0.94 | 3.07 | 3.762 (3) | 131 |

 Symmetry codes: (ii) $x+1, y, z$; (iii) $-x, -y+1, z+\frac{1}{2}$; (iv) $-x, -y+1, -z$.

adjacent molecule links the organic cations into [100] chains with adjacent cations related by translation symmetry and the $N1-H2N\cdots Br1$ bond connects the organic cation to the inorganic network. The neutral $N2-H3N$ moiety forms a bifurcated $N-H\cdots(Br2, Br2)$ hydrogen bond; the $H\cdots Br$ contacts are long at 3.07 (3) Å but given their apparent role in bridging the (010) $CsBr_2$ layers we judge them to be structurally significant. The hydrogen-bonding scheme for (II) (Table 4) is almost identical to that in (I).

The $CsBr_6$ prisms in (I) are linked into a striking (010) ‘curtain wall’ arrangement (Fig. 3) by face sharing in the [100] direction and edge sharing (*via* a pair of $Br2$ atoms) in the [001] direction; the $Cs\cdots Cs$ separation through the prism-ends is 4.5787 (8) Å (by the symmetry operations $x+1, y, z$ and $x-1, y, z$) and the separation between metal ions in adjacent columns is 5.42014 (12) Å (symmetry operations $x, \frac{1}{2}-y, -z$ and $x, \frac{1}{2}-y, \frac{1}{2}+z$). The equivalent data for the Rb atoms in (II) are 4.4675 (13) and 5.2338 (14) Å, respectively. When

Figure 3
 Polyhedral view of part of an (010) layer of $CsBr_6$ trigonal prisms in (I).

viewed down [100], the prisms adopt a ‘saw-tooth’ arrangement with respect to the [010] direction, with alternating columns of prisms pointing ‘up’ and ‘down’ (Fig. 4).

4. Database survey

So far as we are aware, the $RABr_2$ topology of the title compounds is a novel one. A search of the Cambridge Structural Database (CSD, version 5.40, last update 19 May 2019; Groom *et al.*, 2016) for the mono-protonated $C_4H_{11}N_2^+$ cation returned 55 crystal structures but none of them bear a close resemblance to the title compound. As noted in the chemical context section, the doubly protonated $C_4H_{12}N_2^{2+}$ species occurs in several hybrid RMX_3 perovskites including $C_4H_{12}N_2\cdot ACl_3\cdot H_2O$ with $A = K$ (CSD refcode GUYMIX), Rb (GUYMOD) and Cs (GUYMUJ) (Paton & Harrison, 2010) and $C_4H_{12}N_2\cdot NaI_3$ (MEXMAG; Chen *et al.*, 2018).

5. Synthesis and crystallization

Compound (I) was prepared by adding 0.213 g (1.0 mmol) of CsBr and 0.086 g (1.0 mmol) of piperazine to 11.0 ml (1.1 mmol) of a 0.1 M HBr solution in a Petri dish to result in a clear solution. Colourless rods of (I) formed after a few days as the water evaporated. Colourless rods of (II) were prepared in the same way, with 0.165 g (1.0 mmol) of RbBr replacing the CsBr. The quantity of acid appears to be critical to the syntheses of (I) and (II): smaller amounts lead to recrystallized CsBr and RbBr and larger amounts lead to different structures containing doubly protonated $C_4H_{12}N_2^{2+}$ cations.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 5. The N-bonded H atoms were located in difference-Fourier maps: for (I), their positions

Figure 4

Computer programs: *CrystalClear* (Rigaku, 2013), *SHELXS97* (Sheldrick, 2008), *SHELXL2018* (Sheldrick, 2015), *ORTEP-3 for Windows* (Farrugia, 2012), *ATOMS* (Shape Software, 2005) and *pubCIF* (Westrip, 2010).

were freely refined, for (II) they were refined as riding atoms in their as-found relative positions. The C-bound H atoms were placed geometrically (C–H = 0.99 Å) and refined as riding atoms for both structures. The constraint *U*_{iso}(H) = 1.2*U*_{eq}(carrier) was applied in all cases. The displacement ellipsoids for the C and N atoms in (II) refined to somewhat elongated shapes suggestive of positional disorder of the C₄H₁₁N₂⁺ cations but attempts to model this did not lead to a significant improvement in fit.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

 $w = 1/[\sigma^2(F_o^2) + (0.036P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\max} < 0.001$ $\Delta\rho_{\max} = 0.74 \text{ e } \text{\AA}^{-3}$ $\Delta\rho_{\min} = -0.47 \text{ e } \text{\AA}^{-3}$ *Special details*

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
