

Fig. S1. Correlation between air and water mean daily temperatures recorded in Tagus estuary from April 2018 to September 2019.

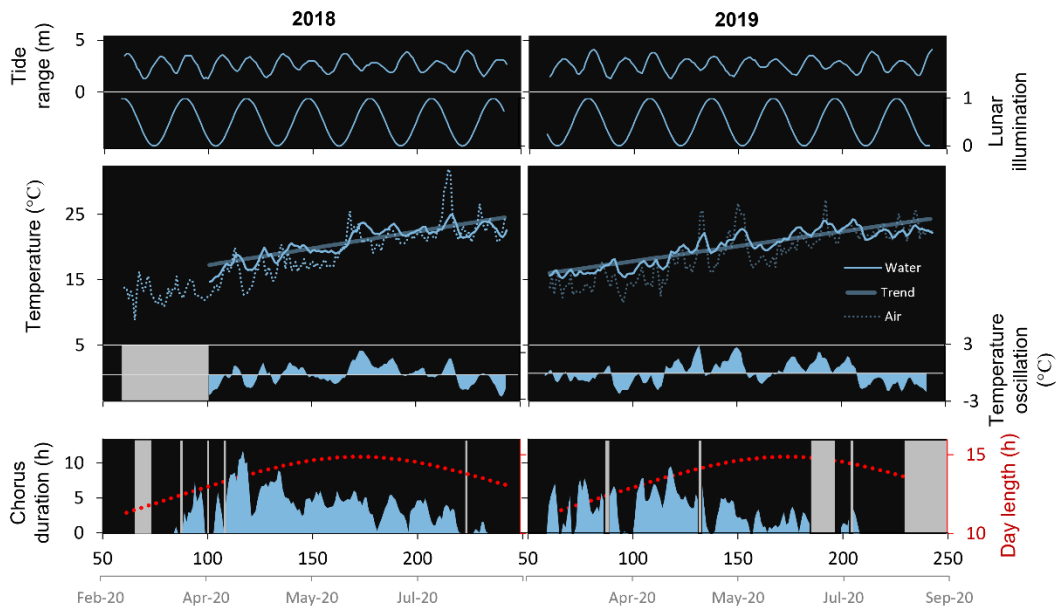

Fig. S2. Daily chorus duration and variables that were tested as triggers of meagre chorusing behaviour. The variables used were related to lunar cycle (tide range and lunar illumination or moon phase), duration of daily light and dark periods (daylength is represented, but timing of sunrise and sunset were also considered), and water temperature (temperature trend and oscillation derived from daily mean temperature). Mean daily air temperature is also represented for comparison. Shaded areas in temperature variation and chorus duration represent absence of recordings.
