Received 3 June 2011; accepted 20 June 2011

Key indicators: single-crystal X-ray study; $T = 93$ K; mean $\sigma(\text{C}-\text{C}) = 0.006$ Å; R factor = 0.090; wR factor = 0.256; data-to-parameter ratio = 16.0.

The dioxaphospholane ring in the title compound, $\text{C}_{20}\text{H}_{17}\text{O}_3\text{P}$, adopts an envelope conformation about one of the ring carbons. The benzene rings of the compound do not form face-to-face π - π interactions, instead weak $\text{C}-\text{H}\cdots\pi$ interactions occur between adjacent molecules. The methine H atoms on the dioxaphospholane ring form weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds to the oxide group of an adjacent molecule.

2,4,5-Triphenyl-1,3,2-dioxaphospholan-2-one

D. B. Cordes, G. Hua, A. M. Z. Slawin and J. D. Woollins

Comment

The previously known title compound (Ovchinnikov *et al.*, 1995) has been prepared by the reaction of Woollins' reagent with 1,2-diphenylethane-1,2-diol. The resulting dioxaphospholane ring in the title compound is similar to the only three structurally known phospholanes, bond lengths about P being very similar (P—O, 1.586–1.604 Å, P=O, 1.461–1.467 Å, P—C, 1.765–1.815 Å; Hoppe *et al.*, 1985, Han *et al.*, 2008 and Ananikov *et al.*, 2010). The dioxaphospholane ring displays an envelope conformation about C1, the torsion angles O2—P1—O1—C1 and P1—O2—C2—C1 being 19.0 (2) and -18.8 (3) °, respectively. The phenyl rings in the title compound do not form face-to-face π - π interactions, instead weak CH $\cdots\pi$ interactions result at a distance of 2.94 (5) Å. The phospholane oxide oxygen forms weak hydrogen bonds with the H1 and H2 H atoms, at distances of 2.29 (4) and 2.59 (4) Å forming chains along the [0 1 0] direction.

Experimental

A mixture of diphenylethane-1,2-diol (0.214 g, 1.0 mmol) and Woollins' reagent (0.54 g, 1.0 mmol) in 20 ml of dry toluene was stirred at room temperature for 3 h. Then the mixture was heated to 60 °C with stirring for 2 h. The red suspension disappeared and a grayish-green solution formed. Following cooling to room temperature and removal of the solvent *in vacuo* the residue was purified by silica gel column chromatography (dichloromethane eluent) to give the title compound as a pale green solid in low yield (0.055 g, 14%). Crystals suitable for X-ray structure determination were obtained from the diffusion of hexane into a dichloromethane solution of the title compound. Selected IR (KBr, cm⁻¹): 1439(*m*), 1269(*m*), 1133(*m*), 992(*s*), 870(*m*), 840(*m*), 716(*s*), 693(*s*), 510(*m*). ¹H NMR (CD₂Cl₂, δ), 8.06–7.94 (m, 2H, ArH), 7.71–7.55 (m, 2H, ArH), 7.23–7.05 (m, 11H, ArH), 5.88 (m, *J* = 9.1 Hz, 2H, CH) p.p.m.. ¹³C NMR (CD₂Cl₂, δ), 134.4, 131.9, 130.9, 130.6, 129.1, 128.4, 128.1, 126.8, 83.9 (COO) p.p.m.. ³¹P NMR (CD₂Cl₂, δ), 34.88 p.p.m..

Refinement

All the crystals chosen appeared to be poorly diffracting at higher angles, with missing independent data in the experimentally measured range. All H atoms were included in calculated positions (C—H distances are 1.00 Å for methine H atoms and 0.95 Å for phenyl H atoms) and refined as riding atoms with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{parent atom})$.

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.090$

$wR(F^2) = 0.256$

$S = 1.01$

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.1305P)^2]$

where $P = (F_o^2 + 2F_c^2)/3$

3462 reflections	$(\Delta/\sigma)_{\max} < 0.001$
217 parameters	$\Delta\rho_{\max} = 0.41 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.53 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 is the centroid of the C15–C20 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C1—H1 \cdots O3 ⁱ	1.00	2.59	3.248 (5)	123 (3)
C2—H2 \cdots O3 ⁱ	1.00	2.29	3.115 (5)	139 (3)
C12—H12 \cdots Cg1 ⁱⁱ	0.95	2.94	3.838 (5)	158 (3)
C12—H12 \cdots C18 ⁱⁱ	0.95	2.83	3.585 (6)	138 (3)

Symmetry codes: (i) $x, y+1, z$; (ii) $-x+1, y+1/2, -z+3/2$.
